Office Action Summary

Application No.

10/710,541

Applicant(s)

CHO ET AL.

Examiner

Hirdepal Singh

Art Unit

2611

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 July 2004.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-18 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-18 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 20 July 2004 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date 7/30/04.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____.

DETAILED ACTION

This action is in response to the original filing date of July 20, 2004. Claims 1-16 are pending and have been considered below.

Drawings

1. The drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they do not include the following reference sign(s) mentioned in the description: On page 15, paragraphs 0030-0031 of specification "... It is obvious that the correlators 130, 150 have substantially the same circuit architecture. However, the data inputted into the correlators 130, 140 are different....", however, in figure 3 there is no correlator marked as 140 or 150. Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Specification

2. The disclosure is objected to because of the following informalities: In reference to figure 2, Paragraph 0028 describes (page 14) "...timing controller 114a ...", whereas figure 2 shows timing controller marked as block 129.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-3, 5-6, 8, 10-12, 14-15 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Awater et al. (US 2005/0152317) further in view of Gummadi et al. (US 7,136,436).

Regarding Claims 1, and 10:

Awater discloses an apparatus of detecting interference of a symbol for adjusting a boundary of the symbol utilized by an OFDM system (abstract; paragraph 0054), the apparatus comprising:

- a first correlator (405 in figure 7 through DC sub $a_1(n)$) for computing a first correlation value representing the correlation between at least one of first signals of a first symbol and at least one of second signals of a second symbol (figures 5 and 7 ; paragraphs 0037, 0061 and 0062), wherein the at least one first signal is transmitted via a first sub-carrier and the at least one second signal is transmitted via a second sub-carrier (figure 9a; paragraph 0084 where the different samples are sent using different sub carriers) adjacent to the first sub-carriers;
- a second correlator (405 in figure 7 through DC sub $a_2(n)$) for computing a second correlation value representing the correlation between the at least one first signal and at least one of third signals of a third symbol (paragraphs 0040, and 0046-0047) (as clearly stated in claim number 6) next to the first symbol, wherein the at least one first signal is transmitted via the first sub-carrier and the at least one third signal is transmitted via the second sub-carrier;
- a comparator (320 and 416 in figures 5 and 7) for comparing the first correlation value with the second correlation value ("the first correlation value for 10 or 12 symbols is coming through the top path i.e. block 312(1) and as input s_1 , second correlation value is coming through the bottom path" ; paragraphs 0056, 63); and
- a timing controller (120 in figure4; paragraph 0034) for adjusting the timing of the boundary according to the comparison result.

Awater discloses all of the subject matter as described above except for specifically teaching that the second symbol is previous to the first symbol, third symbol is placed

Art. Unit: 2611

next to the first symbol (not previous to first symbol) for calculating second correlation value.

However, Gummadi in the same field of endeavor, discloses a similar apparatus and method for boundary detection using multiple correlations, where the received signal is correlate with previous signal (column 5, lines 58-67), where the correlation value is generated by comparing samples in a period with samples in another adjacent period (abstract; column 6, lines 1-7, 35-42, and 56-67), and a control signal to control the functions of the system (figure 10).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to generate correlations of adjacent symbols as taught by Gummadi in the Awater system in order to take advantage of transmission efficiencies by modeling plurality of sub-carriers closely spaced in frequency and modulated by a unique frequency offset value as they are orthogonal thus the interference is negated at the receiver. Also to generate a correlation value by comparing adjacent period samples i.e. a period previous to first one or by comparing a period next to first one in order to see the presence of sequence boundary more rapidly and to make more reliable interference rejection.

Regarding Claims 2, and 11:

Awater discloses all of the subject matter as described above, except for specifically teaching that the signals include a plurality of pilot and data signals.

However, Gummadi in the same field of endeavor discloses that the signal packets could be data signals and control signal i.e. pilot signals (column 1, lines 15-25).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to transmit symbols including plurality of pilot signals and data signals in Awater. One would have been motivated to include plurality of pilot signal and plurality of data signals in the symbols in order to get the real data send with the related control or reference information as well.

Regarding Claims 3, and 12:

Awater discloses all of the subject matter as described above, and further discloses that the first correlator comprises;

- a. a conjugating unit for computing the conjugating value of first data (figures 5, and 7; paragraph 0047);
- b. multiplying unit for multiplying conjugated data with second data for generating product value (figures 5, and 7; paragraph 0047);
- c. correlation value computer generating correlation value according to product value i.e. an adder (figures 5, and 7; paragraph 0047).

Regarding Claims 5, and 14:

Awater discloses all of the subject matter as described above, and further discloses that the correlation value is calculated based on square of the absolute value

Art Unit: 2611

and then the squared values are added in a summation unit (paragraphs 0037, and 0056).

Regarding Claims 6, and 15:

Awater discloses all of the subject matter as described above, and further discloses that the second correlator used for generating second correlation value comprises;

- a. a conjugating unit for computing the conjugating value of first data (figures 5, and 7; paragraph 0047);
- b. multiplying unit for multiplying conjugated data with the adjacent data(third data) for generating product value (figures 5, and 7; paragraph 0047);
- c. correlation value computer generating correlation value according to product value i.e. an adder (figures 5, and 7; paragraph 0047).

Regarding Claims 8, and 17:

Awater discloses all of the subject matter as described above, and further discloses that the correlation value is calculated based on square of the absolute value and then the squared values are added in a summation unit (paragraphs 0037, and 0056).

5. Claims 4, 7, 13 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Awater et al. (US 2005/0152317) in view of Gummadi et al. (US

Art Unit: 2611

7,136,436) as applied to claims 1, 3, 6, 10-12 and 15 above and further in view of Narasimhan (US 7,218,691).

Regarding Claims 4, and 13:

Awater discloses all of the subject matter as described above, and further discloses that the correlation value calculation includes a summation unit or an adder (figures 5, and 7; paragraph 0047), except for specifically teaching that the correlation is based on the absolute value of the product.

However, Narasimhan in same field of endeavor discloses a similar method and apparatus for estimating the timing of OFDM symbol by generating a correlation value with comparison of sum of correlation with a prior and a subsequent value (abstract; figure 8; column 2, lines 48-54), and further discloses that the correlation value is generated based on the sum of absolute values (column 2, lines 35-47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use and absolute value calculating unit as taught by Narasimhan in Awater system to generate the correlation value in order to quantize the sign bits of the received signal.

Regarding Claims 7, and 16:

Awater discloses all of the subject matter as described above and further discloses that the correlation value calculation includes a summation unit or an adder

Art Unit: 2611

(figures 5, and 7; paragraph 0047), except for specifically teaching that the correlation is based on the absolute value of the product.

However, Narasimhan in same field of endeavor discloses a similar method and apparatus for estimating the timing of OFDM symbol by generating a correlation value with comparison of sum of correlation with a prior and a subsequent value (abstract; figure 8; column 2, lines 48-54), and further discloses that the correlation value is generated based on the sum of absolute values (column 2, lines 35-47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use and absolute value calculating unit as taught by Narasimhan in Awater system to generate the correlation value in order to quantize the sign bits of the received signal.

6. Claims 9 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Awater et al. (US 2005/0152317) in view of Gummadi et al. (US 7,136,436) as applied to claims 1 and 10 above, and further in view of Mui (US 6,690,739).

Regarding Claims 9, and 18:

Awater discloses all of the subject matter as described above except for specifically teaching, using an equalizer and a slicer for equalizing and then slicing the second symbol.

However, Mui in the same field of endeavor discloses a similar method and system for interference compensation, and further discloses using an equalizer and a

Art Unit: 2611

slicer in the inter symbol interference compensation decoder (figure 18; column 31, lines 18-57).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use the equalizer and the slicer in Awater to equalize the second symbol and then slicing the symbol to generate a signal in order to cancel the intercarrier or multipath interferences in the signal. Similarly, one of ordinary skill in the art would use an equalizer and a slicer for the third symbol to generate third signal.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- a. Chow et al. (US 2005/0276340) discloses a method for determining symbol boundary in a multiple sub-carrier system.
- b. Kelley et al. (US 2005/0135432) discloses a system and method for OFDM frequency offset estimation using signals sent by different sub carriers.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hirdepal Singh whose telephone number is 571-270-1688. The examiner can normally be reached on Mon-Fri (Alternate Friday Off) 8:00am-5:00pm (EST).

Art Unit: 2611

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shuwang Liu can be reached on 571-272-3036. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
